2Talk Headset Getting-Started Video:

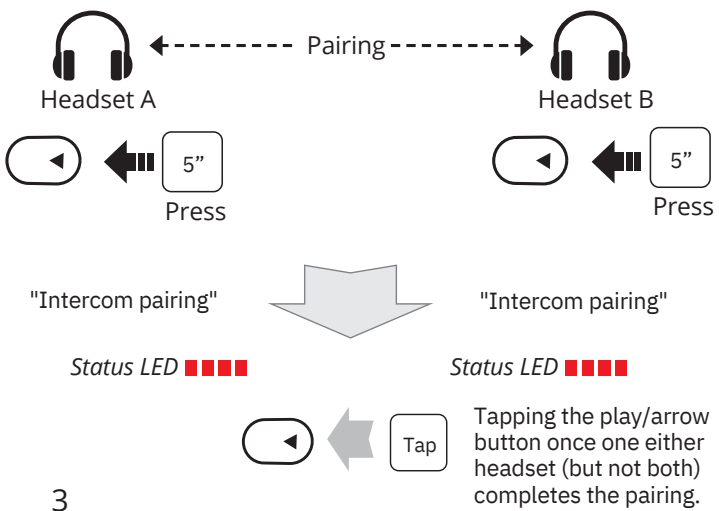

Please scan the QR code here with your smartphone camera to instantly view our video -

NOTE: Your headsets have been paired before being delivered to you. They will remain paired even when shut off. You do not need to follow the steps below unless troubleshooting.

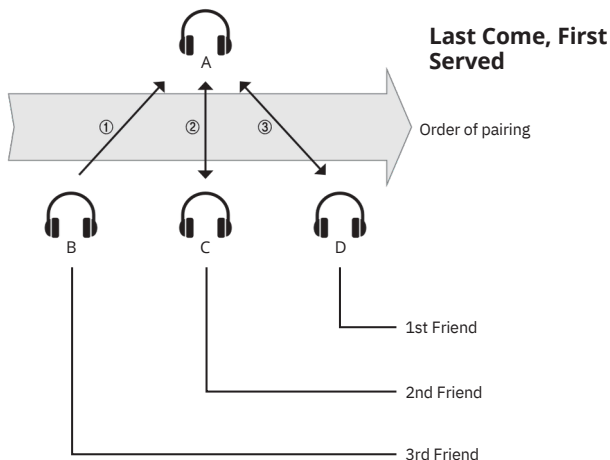

Headset Pairing Intercom

To **re-pair the 2Talk headsets**, press the play/arrow button on each headset for about 5 seconds to activate intercom pairing mode. You will hear several beeps and then the voice message "Intercom Pairing". Additionally, the red LED will flash rapidly. Once both 2Talk headsets are in pairing mode, just tap the center play/arrow button on either one of the headsets to connect. Wait 2 or 3 seconds and they will be connected and paired. At this point both sets show the blue LED and will double flash in a heartbeat pattern while connected.

To go into **standby mode** (still paired but conversation interrupted), either headset user (but not both) can tap the center play/arrow button once. In standby mode the blue LED flashes slowly. Either headset can tap the play/arrow key again to reconnect and continue their conversation.

Important Battery Tips

Battery Lifespan Tips:

Do not charge for extended periods of time

Charge up to 2.5 hours—this gives you over 90% battery even if the blue light hasn't come on. Little benefit comes from charging longer. To check exact charge, count the red flashes at power-up (see page 2). Avoid fast-chargers and overnight charging; use a standard phone USB adapter.

Avoid extreme ambient temperatures

Your headsets work best between 32–95°F (0–35°C). Avoid leaving your headsets in hot conditions (above 95°F/35°C) or charging them at higher temperatures. It is not recommended to leave your headsets baking in the sun as temperatures can quickly rise beyond recommended levels. Storing your headsets in a very hot environment for very long periods can also damage your battery capacity. High temperatures can permanently reduce capacity and your battery may not power your device as long on a given charge. Colder temperature may temporarily lower run time, but performance returns once the battery warms up.

Battery Lifespan Tips

Remove from cases during charging:

If you store your headsets in bags or storage cases, remove them before charging. Charging your device when in it's case may generate excess heat and this can affect battery capacity.

Store it half-charged when you store it long term

If you want to store your device long term, two key factors will affect the overall health of your battery: the ambient temperature, and the percentage of charge left on the battery when it's powered down for storage. Therefore, we recommend you store your device at about 50% charge in a cool place.

Avoid storing it fully charged or fully drained, as both can damage the battery over time.

If you plan to store your device for longer than six months, charge it to 50% every six months. Use the flashing red LED light upon power-up to determine battery charge level (**2 flashes is 50%**).

Depending on how long you store your device, it may be in a low-battery state when you remove it from long-term storage.

After it's removed from storage, it may require charging before you can use it.

Troubleshooting

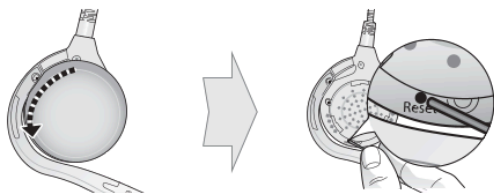

Factory Reset

If you want to restore the headset to factory default settings, use the **Factory Reset** in the configuration menu. The headset automatically restores the default settings and turns off.

Fault Reset

If the headset is not working properly and you wish to do a hard fault Reset follow these instructions.

1. Rotate the speaker pad of the left headset counterclockwise to detach it.
2. Insert a paper clip into the reset pin-hole and press the reset button for a second using light pressure. Fault Reset will not restore the headset to the factory default settings.
3. It is recommended to do a factory reset after the Fault Reset if you wish to bring the headsets back to the factory specifications
